Sales Saathi AI: Product Requirements Document

AI-Powered Sales Intelligence Agent | BITSoM × Masai School, Product Management Capstone

Team: Kaushik G, Vrunda MukeshKumar Lad, Rajat Jiwanprakash Katekhaye, Tiwari Shruti Pravinbhai

Status: MVP prototype built (v0.4.0). Beta test and metrics validation are planned, not yet run.

1. Overview

Sales Saathi ("Saathi" means trusted companion in Hindi) is an AI agent that prepares B2B sales representatives for client meetings. It collects company news, financial signals, leadership changes, social signals and CRM context, then delivers a concise one-page brief before each meeting. After the meeting it supports structured notes and smart follow-ups.

Positioning: for B2B sales professionals who lose deals because of poor preparation and inconsistent follow-up, Sales Saathi is the AI sales intelligence agent that delivers ready-to-use pre-meeting briefs, structured notes and smart follow-ups, so every rep walks into every meeting prepared and confident.

2. Problem Statement

How might we design an AI-powered agent that automatically curates and delivers timely, contextual company insights to sales representatives before meetings, so they are better informed and spend less time on manual research?

Pain points found in research:

- Time-consuming meeting preparation: reps reported spending about 1-2 hours researching before a client call, which takes time away from selling.
- Scattered information: relevant data sits across email, calendar, LinkedIn, company websites, CRM and news sources, so reps switch between many tools and risk missing insights.
- Unstructured meeting insights: discussion points, stakeholders, buying signals and action items are captured inconsistently.
- Difficult follow-ups: tracking actions and writing personalized outreach is manual, which causes delays and lowers conversion.

3. Goals and Non-Goals

Goals (MVP):

- Cut manual meeting-preparation time against the 1-2 hour baseline.
- Deliver a ready-to-use one-page brief 30 minutes before each scheduled meeting.
- Help reps build rapport and send personalized outreach faster.
- Keep the rep in control: every AI output is reviewed by the rep before it reaches a client.

Non-goals (not in this release):

- Real-time translation and multilingual support.
- Automated lead generation and scraping.
- Interactive demo sandbox for prospects.
- Safe LinkedIn semi-automated workflows.

4. Target Users

Primary: sales representatives and account executives in B2B SaaS companies (50-500 employees) who handle 5-15 client interactions per week and rely on CRM and LinkedIn for research.

Secondary: sales managers who want team-level visibility into deal readiness and follow-up consistency; marketing teams.

Persona 1: Arjun Mehta, SDR / outbound sales rep (age 24-30, mid-sized B2B SaaS)

- Goals: hit monthly lead-qualification targets, convert more discovery calls to demos, spend less time on manual LinkedIn and Apollo research.
- Pain points: personalization is time-consuming and often skipped; information is scattered; follow-ups are inconsistent and often forgotten.
- Quote: "Follow-ups are the most important part of sales - that's how connections are maintained and deals are actually closed."

Persona 2: Priya Nair, senior account executive / BD manager (age 30-42, enterprise SaaS)

- Goals: close large enterprise deals, maintain stakeholder relationships, shorten discovery-to-close cycles.
- Pain points: most leads are cold; stakeholder mapping across complex organizations is hard; no in-call AI guidance; too much time on research before calls.
- Quote: "Most of the time goes into scraping leads - only a handful are actually worth pursuing."

5. Research Summary

- 5 Jobs-To-Be-Done (JTBD) interviews with practicing sales professionals across B2B SaaS, insurance and technology.
- 5 interviews with Apollo.io users to understand renewal objections.
- 3 interviews with business owners from different industries to understand the customer-support journey.
- A 5-stage user journey (Awareness, Consideration, Acquisition, Service, Loyalty) mapping actions, touchpoints, feelings, pain points and opportunities.
- Competitive analysis. Direct competitors: Jump AI, Avoma, Otter.ai. Indirect: Salesforce Sales/Einstein GPT, Apollo.io, web browsers.
- Interview finding that shaped the design: "AI can assist in sales, but it cannot build trust like a human," which led to the human-in-the-loop principle.

6. User Stories

- US-01: As an SDR, I want an automated pre-meeting brief about my prospect, so I can prepare faster and walk in with relevant talking points.
- US-02: As a sales rep, I want an AI-generated ice-breaker based on the client's profile, so I can build rapport quickly.
- US-03: As an account executive, I want a stakeholder map for each deal, so I know the decision-makers and influencers.
- US-04: As a sales rep, I want a BANT qualification checklist auto-populated from discovery call notes, so I can quickly decide whether a lead should move forward.
- US-05: As a sales manager, I want lead scores ranked by intent signals, so my team focuses on the highest-ROI prospects.
- US-06: As a sales rep, I want AI-suggested follow-up messages with optimal send timing, so I never miss a follow-up window.
- US-07: As a BD manager, I want competitive intelligence embedded in my prep brief, so I can position our solution against unknown competitors.
- US-08: As a sales rep, I want a real-time AI co-pilot during calls that surfaces relevant case studies and product information, so I can answer questions without switching tabs.
- US-09: As a sales rep, I want a personalized outreach message focused on the client's pain points, so my first message gets a higher response rate.
- US-10: As a sales team lead, I want automatic CRM sync of meeting summaries and next steps, so the CRM stays updated without manual entry.

7. Prioritization (MoSCoW)

We generated 20+ feature ideas using ERRC and Nominal Group Technique, mapped them to validated interview pain points, and prioritized 15 features.

Must Have:

- Auto pre-meeting brief (AI research summary)
- Smart ice-breaker generator
- Pain-point based outreach message generator

Should Have:

- Post-meeting summary and next-steps generator
- Smart follow-up nudge system
- Lead scoring and high-intent lead identification
- BANT qualification checklist

Could Have:

- Stakeholder identification and mapping tool
- Competitive insight assistant
- Real-time AI sales co-pilot (in-call guidance)
- Deep CRM auto-sync

Won't Have (now): real-time translation and multilingual support, automated lead generation and scraping, interactive demo sandbox, safe LinkedIn semi-automated workflows.

Rationale: the three Must Haves address the top interview pain points (prep time, scattered information, personalization) and can be delivered with existing APIs and pre-built AI models.

8. Functional Requirements (MVP)

FR-1: Auto Pre-Meeting Brief

- The system detects a scheduled meeting from the rep's calendar.
- It generates a one-page brief containing company background, recent news, LinkedIn profile, likely pain points and suggested talking points.
- The brief is delivered 30 minutes before the scheduled meeting.
- Prototype v0.4.0 implements Gemini-powered company briefs and Gmail notifications sent 30 minutes before calls.
- Every AI-generated output is clearly labeled as AI-generated.

FR-2: Smart Ice-Breaker Generator

- Suggests 2-3 personalized conversation starters based on the client's profile.

FR-3: AI Outreach Generator

- Turns meeting intelligence into personalized cold emails, LinkedIn messages, follow-ups and outreach sequences, focused on the client's pain points rather than on the product.

FR-4: AI Sales Copilot

- In-platform assistance for objection handling, messaging suggestions, meeting preparation and prospect research. Note: this appears in the MVP feature list but is a Could Have in MoSCoW (see Open Questions).

Follow-on (Should Have): post-meeting summary and next steps, follow-up nudges with timing, BANT checklist, lead scoring, CRM sync.

9. User Flows

- Registration: visit site, sign up with Google, Microsoft or email, verify email, account created. Returning users sign in, with password reset by email.
- Onboarding: complete profile, provide basic details, select meeting platform, connect tools (calendar, Slack, Salesforce and others).

- Meeting preparation: meeting detected, brief delivered by email or Slack, rep reviews and edits the brief, meeting happens, rep reviews the AI summary, edits, sends the follow-up email, and pushes updates to the CRM.

10. Technical Approach

Decision: hybrid build and buy, chosen for speed, cost and control at MVP stage.

- Build internally: AI orchestration and prompt engineering (core IP) and the frontend/dashboard (UX differentiator).
- Outsource through APIs: LLM provider, data enrichment (news, LinkedIn, CRM data), CRM integration (Salesforce, HubSpot) and cloud hosting.

Planned agent pipeline (human-in-the-loop): read the calendar event, fetch CRM data, collect news and LinkedIn information, run enrichment, then generate and deliver the brief.

AI layers: generative AI for briefs, drafts and summaries; retrieval-augmented generation to ground responses in real data and reduce hallucinations; classification for BANT and intent signals; timing intelligence for follow-up nudges.

Note: the design documents list GPT-4o and Claude as options; prototype v0.4.0 uses Google Gemini.

11. Success Metrics

These are targets to validate, not measured results.

Product metrics:

- Prep time per meeting versus the 1-2 hour baseline.
- Self-reported confidence score and deal-stage progression in the beta.
- Brief adoption rate: more than 60% by Day 30.
- Day-7 retention: more than 75%.
- Monthly churn: below 2%.
- Net revenue retention: more than 110%.
- Viral coefficient (K-factor): more than 0.5.
- First response time for support: under 5 minutes.

Engagement signals: weekly and monthly active users, session frequency, meetings prepared, feature engagement, CSAT and NPS.

12. Testing and Validation Plan

- Unit testing of each AI module: brief accuracy, BANT extraction, follow-up timing logic.
- Integration testing: calendar trigger to brief, CRM sync, enrichment pipelines, LLM response chains.
- Prompt QA and hallucination testing with adversarial prompts and edge-case client profiles.
- User acceptance testing: onboard 8-10 beta sales reps for a 2-week trial, tracking prep-time reduction, brief quality, workflow fit and NPS.
- A/B testing: compare two variants of the brief format and follow-up nudge copy across user cohorts, measuring open rate, click-through rate and self-reported confidence.

13. Go-to-Market and Pricing

Pricing (tiered SaaS, per user per month): Basic (limited sources), Pro (full insights plus CRM integration), Enterprise (custom sources and admin controls). A freemium tier of 3 briefs per month supports product-led growth.

Go-to-market: product-led growth first, sales-led second, partner-led third.

- Pre-launch (weeks 1-4): waitlist campaign, a "Sales Prep Audit" tool, 10 power-user beta accounts.

- Launch (week 5): Product Hunt launch and a LinkedIn Live demo.
- Post-launch (weeks 6-12): freemium tier, shareable brief exports, weekly ROI email and a referral program.
- Channel rollout: months 1-3 product-led growth (LinkedIn, Product Hunt, sales communities); months 4-6 outbound enterprise sales; months 7-12 partner ecosystem (Salesforce AppExchange, HubSpot Marketplace, Apollo.io integration).

14. Delivery Plan

Methodology: Agile (Scrum), because the product is AI-driven and needs continuous iteration with user feedback.

- Week 1: planning and scope freeze.
- Week 2: design (wireframes, user flows, architecture, API selection).
- Weeks 3-5: core MVP development (pre-meeting brief, meeting summary, follow-ups).
- Week 6: integration (CRM, news and LinkedIn APIs, pipeline testing).
- Week 7: testing and UAT.
- Week 8: final iteration, demo and documentation.

Work is tracked on a Jira board (Sales Saathi - AI Sales Agent).

15. Risks and Ethical Considerations

- Data privacy: sensitive CRM and client data. Mitigation: encryption, access control, GDPR compliance.
- Bias and accuracy: incorrect or biased outputs. Mitigation: human review and diverse data sources.
- Hallucination: wrong insights. Mitigation: retrieval-augmented generation, verified sources, prompt testing.
- Transparency: users unaware of AI content. Mitigation: label all AI-generated output.
- Over-reliance: reduced human judgment. Mitigation: require rep review before any action.
- Data sourcing: unauthorized or scraped data. Mitigation: compliant APIs and licensed data sources.

16. Open Questions

- Beta size: one planning document says 5-10 reps and another says 8-10. Confirm the final number.
- The AI Copilot is listed as an MVP feature but ranked Could Have in MoSCoW. Decide whether it is in or out of v1.
- The 1-2 hour prep-time baseline needs to be confirmed in the beta with timed before and after measurements.
- KPI targets (adoption, retention, churn) have not been validated with real users yet.
